

## Soil Health and a Regenerative Approach (on a large arable/mixed farms)

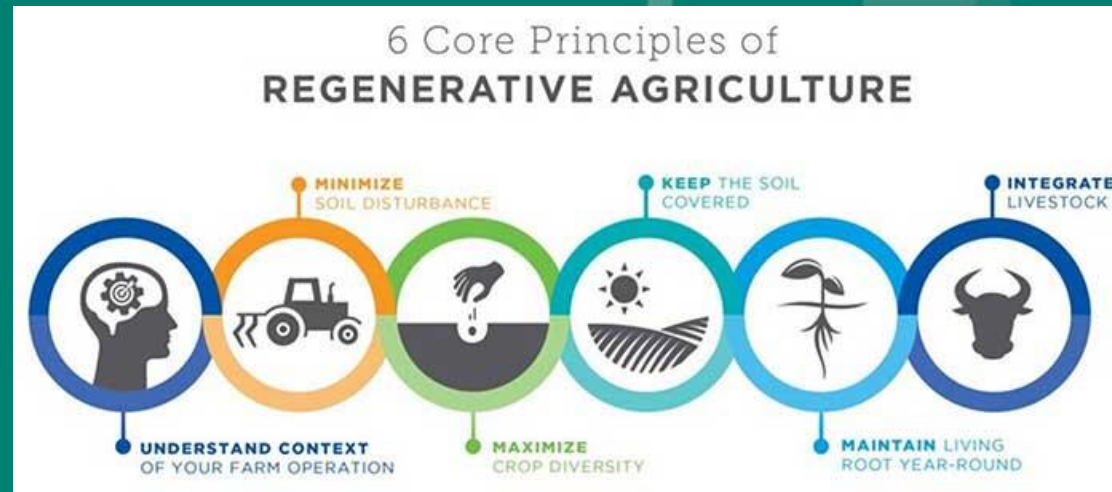

# Definitions

- ▶ There are numerous definitions
- ▶ regenerative agriculture has been defined in a variety of ways, and as differently as “a system of farming principles and practices that **increases biodiversity**, enriches **soils**, improves **watersheds**, and enhances **ecosystem services**” (Terra Genesis International, 2020), to “a long-term, holistic design that attempts to grow as much **food** using as **few resources** as possible in a way that revitalizes the soil rather than depleting it, while offering a solution to **carbon sequestration**” (Rhodes, 2017)
- ▶ Usually a **process**..... and an **outcome**

Rhodes CJ (2017) The imperative for regenerative agriculture. *Science Progress*, 100, 80-129, DOI:

# CONSERVATION AGRICULTURE & SUSTAINABLE FARMING SYSTEMS

UK Agriculture is moving towards a more sustainable farming system. However, there is a need to understand, identify and assess the potential benefits of conservation agriculture and the challenges it poses for adoption to be successful.

## OUR PROJECT:

- Focusing on three different cultivation systems at field scale
- Two UK farms on contrasting soils
- Five-year whole farm rotation
- European project across five countries
- Working alongside farmers, researchers and industry specialists to understand the complexity and riskiness of the systems to provide practical advice for sustainable farming adoption

## UNDERSTANDING IMPACTS OF DIFFERENT FARMING SYSTEMS:

## 3 FARMING SYSTEMS:

**CONVENTIONAL** BASED ON GOOD AGRICULTURAL PRACTICE E.G. INVERSION TILLAGES WITH WINTER AND SPRING CROPS

**SUSTAINABLE SYSTEM 1** BASED ON NON-INVERSION PRACTICES, INCLUDING CATCH AND COVER CROPS

**SUSTAINABLE SYSTEM 2** BASED ON A MORE DIRECT DRILL APPROACH, INCLUDING CATCH AND COVER CROPS

SUSTAINABLE FARMING

SCAN HERE FOR MORE INFORMATION ON SUSTAINABLE FARMING

Conservation agriculture crop establishment techniques can deliver up to 18% uplift in growers net profits, whilst also providing significant enhancement of key environmental and ecological measures, according to the latest findings of the Syngenta Sustainable Farming Initiative.

Presented at the Groundswell event - the UK's leading regenerative agriculture showcase - the five-year project's mid-point review has shown positive returns for financial performance, biodiversity and soil health on the farms involved.

# Building a regenerative approach in the UK

▶ Conservation agricultural (the foundation block) to regenerative/restorative systems

▶ **Reduced Cultivations**

▶ **Wider Rotations**

▶ **Soil Cover**

▶ **Living Roots**

▶ **Grass, Livestock**

**CARBON**

Economic

Cleaner water

Better soil health

Carbon sequestration

Increased Biodiversity

Figure 1. Locations of the farmer research-innovation groups working with the AHDB...

**Background**  
Growing food and fibre crops requires soils to be maintained in a suitable state that provides optimal soil structure, water retention and nutrient availability. The physical, chemical and biological properties of soil interact to deliver these functions. Measuring soil health therefore requires an integrated approach that combines the assessment of the chemical, physical and biological properties of soil. There is a good understanding of the soil chemical and physical constraints to crop and grassland productivity; however, the role of soil biology is less clear.

A key aim of the Soil Biology and Soil Health Partnership is to improve our understanding of soil biology and to explore ways in which farmers can measure and manage soil health. The Partnership has developed a soil health scorecard, which aims to provide information on key indicators of the chemical, physical and biological condition of soil, to help guide soil and crop management decisions.

**Measuring soil health on-farm**  
The Partnership is working with eight farmer research-innovation groups around the UK to evaluate the soil health scorecard approach, and test it on-farm. Further groups will focus on protected cropping and perennial (pew) crops to test the scorecard approach for those systems in the future.

The soil health scorecard brings together information about the chemical, physical and biological properties of soil. "Traffic light" coding is used to identify properties where further follow-up investigation is needed to identify management options that could minimise any potential risks to crop productivity. On-farm in 2018, we tested the scorecard for those soil properties where the evaluation framework is established (e.g. soil nutrients, visual soil assessment score - VESS) or under test (e.g. soil organic matter, SOM). The scorecard is also being tested and validated on research sites and we expect to add indicators for a wider range of soil properties, including biological indicators, in future years.

In autumn 2019, we will continue to test the sampling and recording approach and add some of the most promising biological indicators to the on-farm scorecard.

Table 1. Example scorecards sampled in November 2018 for fields on light soils of the same soil series in the mid-rainfall region (North East England, Midlands, Southern England)

Attribute*	Field A; Farm 1	Field B; Farm 2	Field C; Farm 3
SOM (%)	3.4	2	2.2
pH	6.7	6.9	7.0
Ext. P (mg/l)	40.6	59.6	37.2
Ext. K (mg/l)	158	106	148
Ext. Mg (mg/l)	82	89	144
VESS score	2	2	2
Earthworms (Number/pit)	13	8	1

Table 8. Indicative main effects of nine regenerative systems (expressed as effect of intervention divided by baseline) with illustrative references

Regenerative Intervention	Counterfactual or baseline	Soil carbon	On-farm biodiversity	Mean crop, grass or livestock yield	Input costs	Tree carbon and products
Conservation agriculture	Crop production with intensive tillage	1.09 (Haddaway et al. 2017)	~1.00 (Doran 1980)	0.86-1.01 (Pittelkow et al. 2015)	Lower (Huggins and Reganold 2008)	0
Regenerative organic (e.g. organic crop production with organic amendments)	Crop production with fertilizers and/or agrochemicals	1.07-1.09 (Mondelaers et al. 2009; Tuomisto et al. 2012)	1.30-1.50 (Bengtsson et al. 2005)	0.48-0.92 (Clark & Tilman 2017; Cooper et al. 2016)	Lower to higher (LaCanne and Lundgren 2018; Crowder and Reganold 2015)	0
	Crop production with no amendments or fertilizers	1.07-1.09 (Mondelaers et al. 2009; Tuomisto et al. 2012)	Inconclusive	1.01-1.07 (Hijbeek et al. 2017)	Higher (Crowder and Reganold 2015)	0
Tree crops	Annual crop production	1.18 (Guo and Gifford 2002)	Higher (Simon et al. 2010)	0.75-1.60 (Bidogeza et al. 2015)	Inconclusive	Higher
Tree intercropping	Annual crop production	1.16 (Kim et al. 2016)	1.37 (Torralba et al. 2016)	0.42-1.00 <sup>a</sup> (Garcia de Jalon et al. 2018a)	Lower to higher (Garcia de Jalon et al. 2018b)	Higher
Multistrata agroforestry	Monoculture permanent crops	1.57 (Zake et al. 2015)	Higher (De Beenhouwer et al. 2013)	Variable (Niether et al. 2019)	Inconclusive	Higher
Silvopasture	Grassland	1.00-1.18 (Upson et al., 2013; Seddaiu et al. 2018)	1.21 (Torralba et al. 2016)	0.77-1.18 <sup>a</sup> (Seddaiu et al. 2018) (Torralba et al. 2016)	Similar to higher (Garcia de Jalon et al. 2018b)	Higher
Multi-paddock Grassland	Grassland; continuously grazed	0.99-1.50 (Sanderman et al. 2015; Teague et al. 2011)	Inconclusive	0.98-1.00 <sup>b</sup> (Hawkins 2017) (Derner and Hart 2007)	Higher (Hawkins 2017)	0
Grassland receiving organic fertiliser but not synthetic fertilizer	Grassland: receiving synthetic fertilizer	1.20 (Kidd et al. 2015)	Higher (Mueller et al. 2014)	0.70-1.50 (Mueller et al. 2014) (Kidd et al. 2015)	Inconclusive	0
	Grassland: receiving no fertilizer	1.30 (Gravuer et al. 2019)	0.94 (Gravuer et al. 2019)	1.98 (Gravuer et al. 2019)	Inconclusive	0
Rewilding and abandonment of agriculture	Crop and grazing systems	Higher (Conant et al. 2001)	Variable (Rey Benayas et al. 2007) (Lasanta et al. 2015)	0.11-0.80 (Cerqueira et al. 2015) (derived from Spencer 2017)	Inconclusive	Higher

<sup>a</sup>: Crop and grass yield responses in agroforestry are very sensitive to number of trees per unit area;

<sup>b</sup>: Whilst grass production may be similar; multi-paddock systems may allow higher stocking rates.

Positive effect:  Positive/similar:  Similar or very variable:  Similar or negative:  Negative:

### Regenerative Agriculture

Identifying the impact; enabling the potential

Report for SYSTEMIQ

School of Water, Energy and Environment  
17 May 2019

Each of the nine selected regenerative systems demonstrates positive impacts in terms of increased **soil carbon and/or on-farm biodiversity**

# Albanwise Cultivations

Difficult harvest conditions often make extra cultivations necessary.

Reduced cultivations lead to less fuel and aid increases in organic matter in soil, all positive for net zero journey.

**NET ZERO**  
**2030**

# Albanwise Cultivations

More difficult with potatoes.

However, strip reduced tillage is possible for Maize and Sugar Beet area.

AFL have implemented reduced tillage practices in West Norfolk and North Norfolk with the inclusion of cultivator drills such as the Claydon drill.

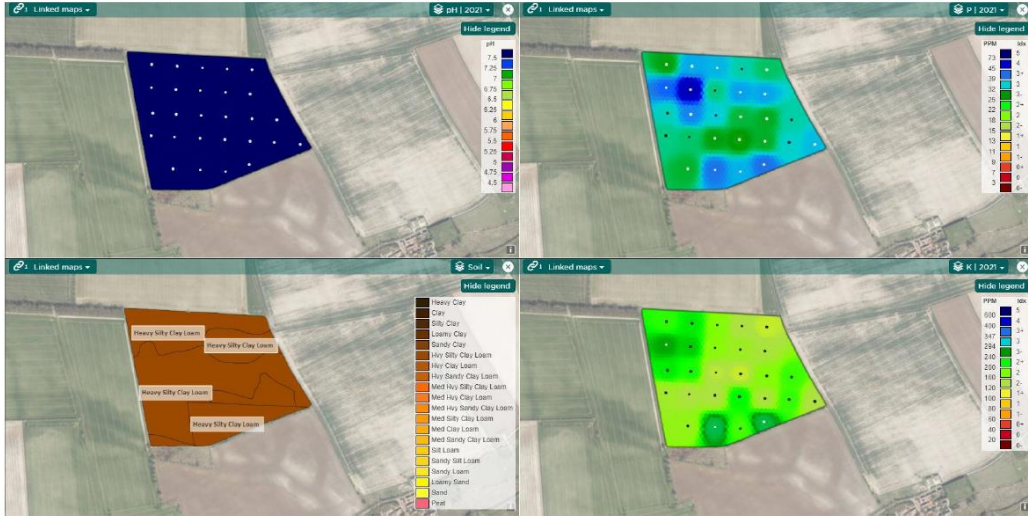

# Albanwise Cultivations - Trials

## Field Analysis

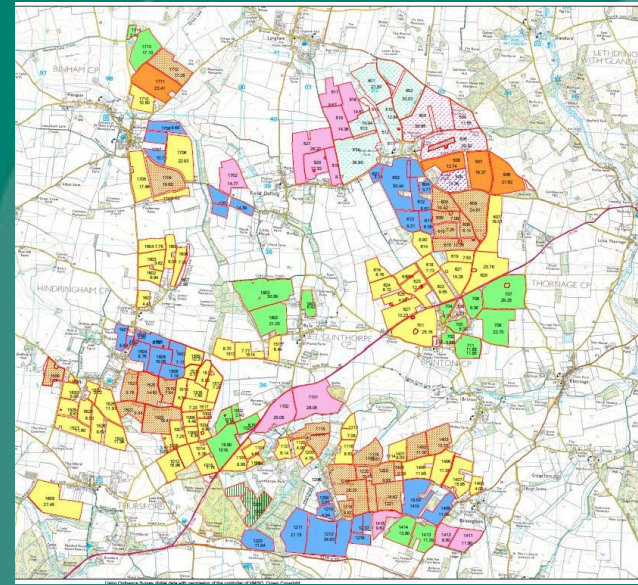

# Albanwise Rotations

Diverse rotations – peas, beans, sunflowers, sugar beet, maize, cereals, potatoes,

Herbal leys ~ next step – Stewardship or SFI?

All farms have comprehensive stewardship.

# Cover Crops

## Herbal leys within an arable rotation

Using natural fertility building systems to boost soil condition.

Nitrogen fixing leguminous plants build soil N whilst deep rooting plants within the mix will break up compaction and harvest nutrients from deeper in the soil profile.

Lots of natural drought tolerance as well.

# Albanwise Soil Cover

- ▶ With the introduction of more cover and companion crops this has increased our soil cover during the growing season.
- ▶ Cultivation Challenges with root crops, crop volunteers – strip tillage?
- ▶ Overgrazing cover crops reduces soil cover.

# Livestock
